

Nuno Góis

Senior Software Engineer

www.nunogois.com

[@me@nunogois.com](mailto:me@nunogois.com)

Senior Software Engineer from Portugal with over 15 years of professional experience across product, infrastructure, and open-source. Comfortable across the full stack and in new domains, with a track record of taking ownership of high-impact work and delivering it to a high standard.

AWS Certified Cloud Practitioner

Unleash

Full Stack Developer (Senior)

04/2022 - Current

- Contributed to Unleash, an open-source feature flag management platform with over 40M Docker pulls, 13.5K+ GitHub stars, and 100K+ monthly active users, from individual developers to Fortune 500 enterprises. Operated across the full breadth of the organization: core product, cloud infrastructure, SDKs, backoffice tooling, and internal systems.
- Assigned to the Enterprise Growth team and later the Self-Service Acceleration squad, consistently led and delivered high-impact features including Service Accounts, Signals & Actions, Custom Root Roles, Groups, Personal Access Tokens (PATs), Login History, Multiple Project Roles, Environment Cloning, Banners, Network Visualization, Slack App integration, and a fully interactive product demo, frequently owning projects end-to-end from discovery through GA.
- Owned and delivered Pay-As-You-Go (PAYG) billing autonomously, a revenue-critical initiative that became the primary self-serve growth driver. Self-serve ARR grew over 70% year-over-year, high-value accounts more than doubled within months, and average deal size increased ~30%.
- Contributed to Unleash Edge, a high-performance Rust-based successor to the Unleash Proxy, picking up Rust from scratch and quickly becoming a meaningful contributor to its core development.
- Led the cloud infrastructure migration away from Pulumi-based provisioning toward a backoffice-driven source of truth for cloud deployments, reducing costs and improving reliability at scale.
- Integrated Stripe billing across multiple projects and third-party systems, enabling users to self-manage subscriptions directly from their Unleash instance, a foundational pillar of the product-led growth motion.
- Created and maintained multiple SDKs including Vue.js, Svelte, Solid, and React Native, expanding Unleash's ecosystem reach. The Vue SDK surpassed 1.9K+ weekly downloads shortly after release.
- Trained as Site Reliability Engineer (SRE) and performed on-call shifts, incident command, and proactive monitoring across AWS/EKS infrastructure to ensure platform availability at scale.
- Acted as a knowledge bridge across disciplines, contributing expertise in full-stack development while continuously growing through close collaboration with teammates in infrastructure, platform engineering, and architecture.
- Leveraged AI-assisted development tools including GitHub Copilot since its early days and Claude Code, not just to accelerate delivery but as thinking partners for architectural debate, design tradeoffs, and code review.
- Built and open-sourced multiple proof-of-concept projects, including a VS Code extension, a browser extension, a CLI, and several framework SDKs.

Zoi

Full Stack Developer (Specialist)

06/2021 - 03/2022

- Assigned to Digital Innovations, worked closely with partners as a developer on exploratory projects using innovative cloud solutions.
- Developed a chatbot built on Google Cloud and Firebase, with a UI in Quasar Framework (Vue.js) and a Cloud Function bridging the UI, Dialogflow CX, and Contentful.
- Contributed to a React Native app used by hundreds of thousands of end-users, delivering features and bug fixes across the product lifecycle.
- Developed an internal mock package for testing and debugging purposes using Node.js, Express, Apollo GraphQL, and MQTT.
- Followed best practices throughout, including writing unit and E2E tests.
- Worked on a dynamic multicultural team following an Agile/Scrum methodology.
- Shared knowledge and learned with teammates through pair programming.

IQA - Sistemas de Gestão, Lda

Full Stack Developer (Lead, Architect)

03/2011 - 05/2021

- Developed AGIR®, a Quality Management Software (QMS), Process Management (BPM), and Document Control platform. Worked on the platform across its full evolution: from ASP.NET, SQL Server, Web API, and .NET WinForms to Windows Services, Office Add-Ins, and beyond.

- Created signature features that give the platform a unique edge in flexibility, including an intuitive drag-and-drop Form Designer, a custom JavaScript framework (based on jQuery, later Vue), and a business logic assistant for workflow and form logic, enabling the platform to adapt to virtually any customer need.
- Worked closely with the project manager and customers to ensure every product delivery met requirements in a versatile, modern, and performant way.
- Supported customers across every stage: configuration, deployment, troubleshooting, and ongoing maintenance.
- Developed APIs, tools, and custom integration mechanisms to connect with existing solutions, databases, and third-party products.
- Built a highly optimized data matrix code scanner from TIFF files in Python, using numpy, CV2, Wand, and related libraries.
- Laid the technical foundation for the company's next product, Wisibi, using Quasar Framework (Vue.js) and .NET Core Web API, following modern best practices throughout.
- Managed the team's Trello, GitHub, Jenkins, and other services.
- Shared knowledge with teammates through training and mentorship.

Thank you for your time.
